

MAGIC SQUARES-2

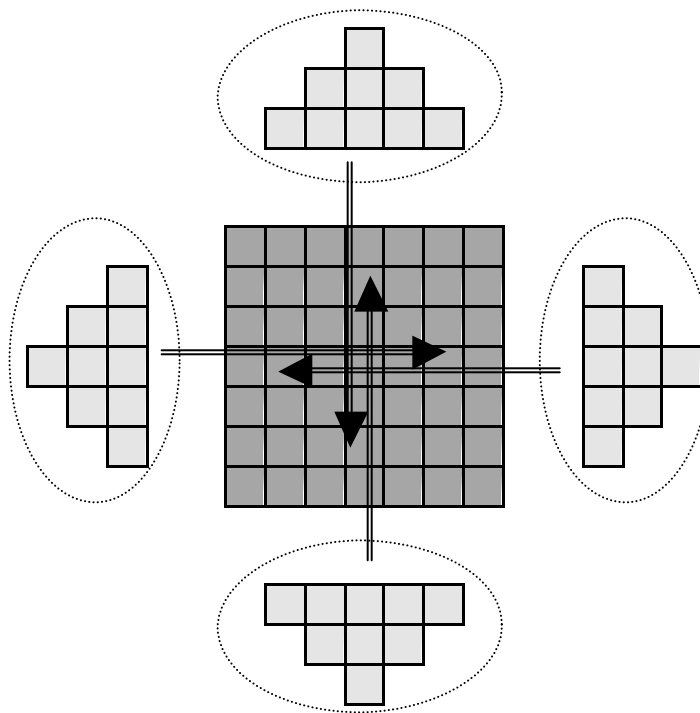

Magic squares of uneven order - 1

In order to build magic squares there are many procedures. The one we propose to you is very simple, although it is only suitable for squares of uneven order. If you follow the instructions carefully, you will be able to build any magic square of uneven side easily:

1. To expand the square with *pyramids* as it is seen in the figure.
2. To write orderly the numbers in the long diagonals (of 7 squares). For example, to start in the long diagonal on the right and to write the numbers from top to bottom.

3. To drag the pyramids outside the square to the remote empty squares within the square: from the upper pyramid to the lower squares, from the lower pyramid to the upper squares, from the right to the left squares and from the left to the right squares:

~~Build~~ **Build**, following these instructions, the magic square of side 5.

YOU WILL NEED:

A board of game 5x5 and the counters with the numbers from 1 to 25.
